

.NET Framework

Overview, Architecture,
Execution

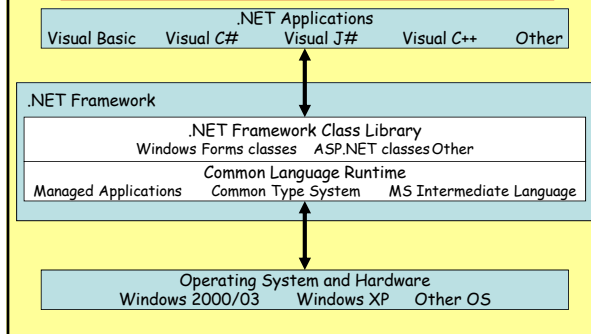

What is the .NET Framework?

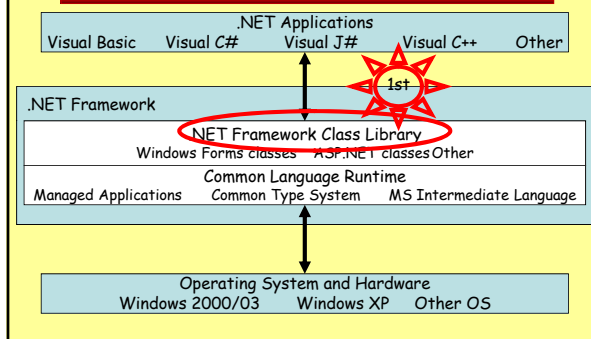

.NET Framework

- ▶ A platform for developing and running applications and XML Web services
- ▶ Framework components
 - ✖ Common language runtime
 - ✖ Class libraries
 - ✖ ASP.NET

.NET Framework (Figure from Boehm)

.NET Framework (Figure from Boehm)

.NET Framework Class Library (FCL)

- ▶ Stores all classes and interfaces of the .NET language
- ▶ ASP.NET classes are used to develop Web Applications
- ▶ ADO.NET classes are used for database interactions
- ▶ Windows System.Forms classes are used for Windows applications
- ▶ Etc.

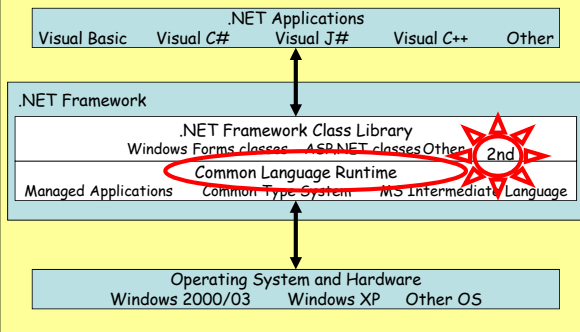

.NET FCL

- ▶ Library is organized hierarchically
- ▶ Related classes are organized into *Namespaces*
 - * sections within the library that contain related classes, structures, enumerations, delegates, interfaces
 - * *When you create a project in Visual Studio IDE, certain namespaces are assumed*
 - * *Others must be imported*

Namespaces You May Use in This Class

- ▶ System.Web
- ▶ System.Data
- ▶ Others
- ▶ but not System.Windows

.NET Framework (Figure from Boehm)

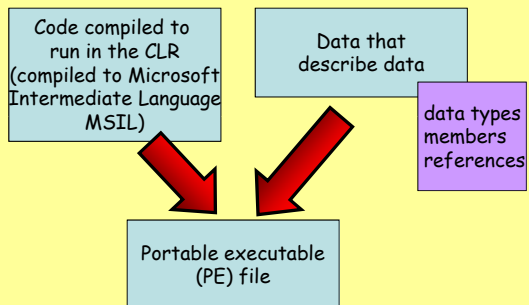

Common Language Runtime (CLR)

- ▶ Manages execution of applications developed in .NET
 - ✖ Integrates components developed in different languages
 - ✖ Handles Common Type System (common data types across all languages)
 - ✖ Handles errors across languages
 - ✖ Handles security
 - ✖ Manages storage and destruction of objects

Types

- ▶ Types: classes, structures, enumerations, delegates, interfaces, data types
- ▶ Any element used in the *As* clause of a declaration
 - ✖ Dim AnyName As SomeType
- ▶ **Value types** - 2 memory locations
 - ✖ Make a copy in memory
- ▶ **Reference types** - 1 memory location
 - ✖ Refer to the original by its memory location

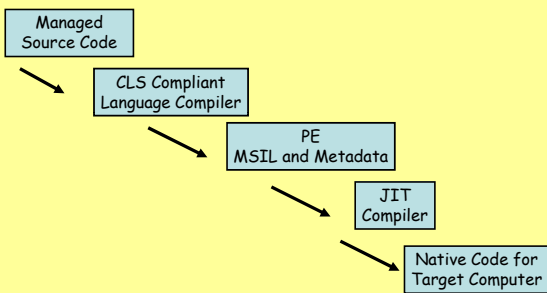

Managed code and Metadata

Common Language Specification (CLS)

- ▶ Published standards that specify how a language that interacts with the CLR should behave

Using .NET CLR to Compile Programs

ASP.NET

- ▶ **Active Server Pages (ASP)**
- ▶ A Web development environment that compiles applications written in .NET compatible languages
- ▶ Uses CLR and managed code features
 - ✖ These are on the Web *server*

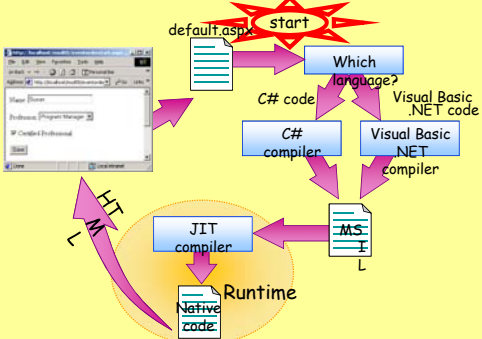

Deploying .NET Windows Applications

- ▶ Target computer must have .NET Framework or .NET Framework Redistributable (dotnetfx.exe)
- ▶ Deployment methods
 - ✖ XCopy deployment - copy necessary files to the target machine
 - ✖ Windows Installer technology - application ships with Windows

Deploying .NET Web Applications

- ▶ Web applications are published to a Web Folder on a web server running IIS
- ▶ The web server has to have the .NET framework installed
- ▶ Users access the application using a browser on a workstation and the URL of the web application
- ▶ Client computers can run any OS, any browser

Runtime Compilation and Execution
