

Brain Development

Here you can see how your brain developed from the time you were a tiny embryo, all nice and comfy in your mommy's womb, to the day you were born.

Cool pictures of a baby's brain working

Red means a lot of brain action

Mommy's milk is the best food for a newborn!

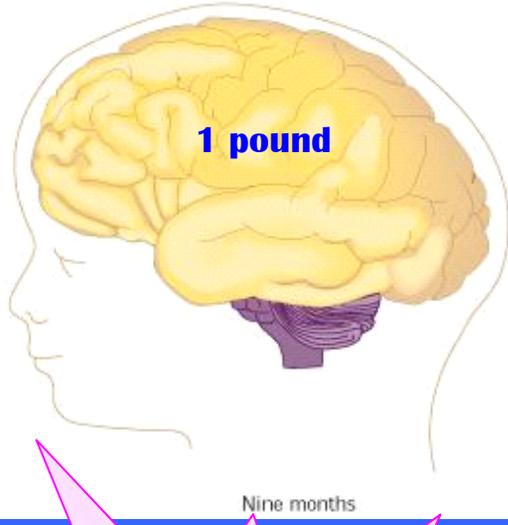

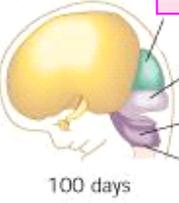

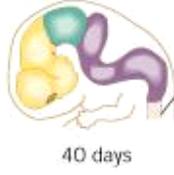

This will become your Spinal Cord

Check out how the forebrain grows and grows !!!

The midbrain grows towards the inside to form the interior structures of the brain

Your brain was almost ready to rock-and-roll, although still needed to get some extra wrinkles in that cortex...

The forebrain will grow to become the CORTEX

DID YOU KNOW?...

- ☺ When you were born, your brain weighed about **1 pound**. No wonder it was so difficult to lift up your head!
- ☺ When you were **3 years old**, your brain weighed about **2.5 pounds**. No wonder why you were so stubborn!
- ☺ At the age of **12**, your brain weighs about **3 pounds**, the same as an adult brain. No wonder you are so smart!

*Lots of music, playing, hands-on experiences and love during the first **three years** of a baby's life will help the brain to be smart and healthy for a lifetime.*

NOT an ALIEN... It was you at 7 weeks.

Your head was so big that you couldn't reach to scratch your nose!
